Your Grade Explained

The score for your competition entry is based on the root mean square error (RMSE) metric achieved by your model when tested with the private test set. This metric quantifies the error in your model, so the lower the RMSE achieved by your model, the better the model is performing.

Your grade for this challenge is out of 100, and is calculated from your score in the competition based on several benchmarks:

- If your model scores an RMSE greater than 12.0, your grade will be 1/100.

- Models that score an RMSE of 12.0 will earn you a grade of 60/100.

- Models that score an RMSE of 10.0 will earn you a grade of 70/100.

- Models that score an RMSE of 9.0 or less will earn you a grade of 80/100.

- Models that score an RMSE of 8.0 or less will earn you a grade of 90/100.

If your model produces an RMSE score between two of these benchmarks, your grade will be calculated proportionally. For example, a model with an RMSE of 11.0 is halfway between the 12.0 and 10.0 benchmarks, which are worth 60 and 70 respectively, so the model would earn a grade of 65.

Support
